

## ABSTRACT

It is an object of the invention to provide a light emitting device which can display a superior image in which  
5 luminescent color from each light emitting layer is beautifully displayed and power consumption is lowered in a light emitting element in which light emitting layers are stacked. One feature of the invention is that, in a light emitting element which comprises light emitting layers stacked  
10 between electrodes, each distance between each light emitting layer and an electrode is approximately oddly multiplied  $1/4$  wavelength by controlling a thickness of a layer provided therebetween to enhance luminous output efficiency. Another feature of the invention is that a drive voltage is lowered  
15 using a high conductive material for the layer compared with a conventional element.
